

PCU Firmware v234 Release Notes

v234:

1. Threshold mode toggle on long press of BB button (in Advanced Menu this functionality can be flipped so a long press does black balance and short press does threshold toggle)
2. Indication when shot has been triggered but is still recording (blinking REC light, indication on LCD switches from REC to TRG)
3. Ability to stop recording of clip after it's been triggered by hasn't reached the end by long-holding the Trigger button. This leaves the clip in RAM.
4. Sped up the countdown on functions that require a long hold to initiate (Partition, Erase Mag, etc.)
